xAssets Hosted Services

Software Discovery Service

xassets
asset · management · software

FEATURES

Software Licence Compliance

Software Installed

Software Recognition

Hardware Inventory

Integrate with Active Directory

Windows and SNMP Discovery

Scalable to Large Networks

BENEFITS

Reliable and affordable

No Agents – Clients are untouched

Low Network Traffic

Instant Results

Discover small networks in minutes, 1000 PCs are discovered in less than 30 minutes

Browser based interface enables access from any PC

Service can be extended

Hosted

No open ports needed

No expertise needed

xAssets Software Discovery Service

The fastest route to Software Compliance and Hardware Inventory, xAssets Software Discovery Service combines the xAssets Enterprise Network Discovery toolset with a hosted service, to give instant software compliance reports and hardware inventory.

The solution is accessed from a web browser and is able to scale to large networks.

Why Hosted ?

This hosted software discovery service enables the fastest route to compliance because there is no server acquisition, no deployment and minimal setup. A small collection server tool is placed on the network and its up and running in minutes.

The hosted service allows discovery for 30 days and reporting for an additional 30 days. Customers can then choose to continue with the hosted service as needed.

Three Steps to Software Licence Compliance

Discover the entire network in minutes, and software purchases can be imported from a variety of data sources including Excel and Accounting Systems. Compliance reports are included and can be configured to customer requirements.

No side effects or client installation

xAssets Network Discovery has virtually no impact on a network and does not leave a footprint on any computer. A scan discovers hundreds of machines concurrently and a single PC takes less than 4 seconds and consumes negligible bandwidth.

No client installation exists regardless of discovery technology selection, so the product does not write any settings, data or software to discovered nodes. Collection servers can be placed anywhere within multiple networks as required.
